

Bakery

In my project I am going to make software for a bakery. The system will help manage the business. Managing prices according to the price of ingredients, how much ingredients to order and goods to produce according to the last sales. Also it will control time of work. If productivity lower than need the program automatically advises you to buy more equipment or hire new employees.

There will be classes for employees and clients. Employees have 2 types: Cook and Seller. Program will have database for products and prices.
